### Introduction

Experimenters conducted this retrospective review to identify factors associated with 30-day sanitarium readmissions following head and neck cancer surgery and to determine whether these readmissions were preventable. Between 2015 and 2018, cases readmitted within 30 days after witnessing surgery for cancers of the head and neck was linked. Over a 3- time period, 26 cases that had head and neck cancer resection with or without reconstruction were readmitted to the sanitarium within 30 days of discharge. A reasonable and doable change in operation could have averted sanitarium readmission for a subset of cases readmitted within 30 days of head and neck cancer surgery. The high mortality rate emphasizes the significance of better understanding this patient population. Numerous cancers of the head and neck can be cured, especially if they're plant beforehand. Although barring the cancer is the primary thing of treatment, conserving the function of the near jitters, organs, and napkins is also veritably important. When planning treatment, croakers consider how treatment might affect a person's quality of life, similar as how a person feels, looks, addresses, eats, and breathes. The common types of treatments used for head and neck cancer are described below. Your care plan may also include treatment for symptoms and side goods, an important part of cancer care.

### Radiation Therapy

Overall, the main treatment options are surgery, radiation remedy, chemotherapy, targeted remedy, and immunotherapy. Surgery or radiation remedy by themselves or a combination of these treatments may be part of the treatment plan. Further treatment details can be plant each specific cancer type section. See the Preface

for a complete list of different types of head and neck cancer. Radiation remedy is the use of high energy rays or other patches to destroy cancer cells. A radiation remedy authority, or schedule, generally consists of a specific number of treatments given over a set period of time. Radiation remedy may be used in different ways to treat head and neck cancers, including helping cure the complaint or lessen the symptoms of cancer and its treatment. It can be used on its own or in combination or in sequence with other treatments, similar as surgery or chemotherapy

Radiation remedy is the use of high energy rays or other patches to destroy cancer cells. A radiation remedy authority, or schedule, generally consists of a specific number of treatments given over a set period of time. Radiation remedy may be used in different ways to treat head and neck cancers, including helping cure the complaint or lessen the symptoms of cancer and its treatment. It can be used on its own or in combination or in sequence with other treatments, similar as surgery or chemotherapy. Before beginning radiation remedy for any type of head and neck cancer cases should be examined by a dentist who has moxie in managing the oral problems related to cancer and its treatment.
