Editorial

We are pleased to present the Volume 30 of the Journal Biomedical Research wherein we have released quality and exemplary works within all the relevant disciplines in biological Sciences and research. The papers in this Issue discuss various aspects of the Current trends in Biomedical Research. Biomedical Research is helmed with experts around the globe as Editors. Biomedical Research has pioneered and encouraged research into the relations between biology and medical sciences.

Biomedical research claims high importance in understanding and accelerating various papers in medical research and various other associated subjects as well. Considering the importance of human health in the current scenario and several emergency medical and clinical issues associated with it, the prime attention towards biomedical research throughout the world is of great significance. Thus, by asserting the requirement of a common and enriched information sharing platform, biomedical research has been serving people with Quality data in every field of Biology and Medical Sciences

Widely read by theoretical and applied scholars, physicians, clinicians, faculty and scientists, the journal publishes articles of a practical or theoretical nature that attempt to advance our understanding of the biomedical sciences. The major concern of the Journal has always been on two things i.e., quality and nature of submission. These aspects are utmost important and are the deciding factors for the quality of the Journal.

As an Editor, I always encourage publication which follows a certain set of principles. The manuscripts submitted have to be novel, the scientific rigour, the originality in paper and also the extent of clarity in writing are the important criteria in the peer-review process.

With this note I encourage and invite all the Young scholars out there, scientists as well as PhD students to bring out their novel fact findings in various disciplines such as, Chemistry, Biotechnology, Biochemistry, Genomics, Immunology,

Haematology, Forensic fields, Toxicology, Pharmacy, Virology, Medicine, Cancer studies, Clinical Trials, Oncology, General health, etc.

I take this opportunity to extend my heart full gratitude to the Editorial Board as well the Reviewers whose tremendous contribution and support has made the Journal to attain its heights. I am deeply indebted to the Reviewers of Biomedical Research for their marvellous support. Their tireless effort cannot be underestimated.

A few facts about the Journal that you might be interested in:

The Journal welcomes the new Editorial Board.

The turnaround time from submission to acceptance has been decreased to 21 days to 14 days.

One of my goals is to reduce the time consumed from the day the manuscript is submitted and published so the Journal has worked to speed up the time it takes by the eminent reviewers to report back and also the time taken by the authors to address the Review comments. I am also glad to announce that the number of reviewers assigned to review a particular manuscript has been increased to three and I hope to continue this number in 2020 and beyond.

In the year 2020 the Journal wished to focus on Social Networking sites such as Twitter, LinkedIn, Whatsapp for ease in communication and also to showcase the articles published in Journal on these platforms in order to gain and grab maximum number of citations.
