Dental Trauma: Assessment of undergraduate dental students: theoretical knowledge and practical use of smartphone application ‘injured tooth’

Adel Abdel Azeem El Bardissy

Cairo University, Egypt

Abstract

Background: Few studies investigated the teaching of Dental Trauma at undergraduate levels, and explored the effectiveness of some teaching interventions on students. The last decade has seen an increasing use of advanced technology within the arena of dental educational intervention. The trend certainly anticipates the overall improvement towards reaching a precise diagnosis and appropriate management of traumatic dental injuries. Some Smartphone Applications are just but examples of this educational technology.

Aim: This study firstly aims at evaluating the knowledge of final year undergraduate students about dental trauma. Secondly, the study assesses the ability of a selected group of the students to diagnose and propose treatment plan/s using a Smartphone Application ‘Injured Tooth’. Design: dental undergraduate final year students, at Faculty of Dentistry, Egypt were invited to complete a Questionnaire on dental trauma after finishing all the lectures and relevant Case Studies’ Sessions. The same questionnaire was used to measure changes in the knowledge level of sixty students selected to use ‘Injured Tooth’ App during answering the Questionnaire.

Results: A total of 274 participated in the study. The mean percentage of correct answers was 77.8% (SD 17.3). The mean values for the total score were 8.4 (SD 1.4), with a range of 5–11. The mean percentage of correct answers of the selected students was 68.97(SD 20.2). The mean percentage of correct answers of the students using the Application was 95.8 (SD7.0).

Conclusions: Knowledge of the students regarding traumatic dental injuries is competent in some areas while considered inadequate in others. The use of the Application was effective in providing accessible knowledge to the students to guide them in proposing the possible management protocols for the different traumatic dental injuries presented in this Study.
