Neuroleptic malignant syndrome presenting with self injurious behaviour
Raghavendra Bakki Sannegowda
Father Muller Medical College, India

Abstract
Neuroleptic malignant syndrome is an emergency condition produced as an ill effect of certain drugs. Tetrad of symptoms includes fever, muscle rigidity, autonomic features, and altered mental status. Pathophysiology underlying this condition is dopamine receptor blockade or depletion of dopamine. Clear workup including identification of other systemic and neuropsychiatric conditions with overlapping symptoms is important for accurate diagnosis of this condition. Treatment includes immediate withdrawal of causative and use of dopamine agonists and muscle relaxants.

Biography
Raghavendra Sannegowda is currently affiliated to Associate Professor, Department of Neurology, Father Muller Medical College, INDIA, continuing research in the specialized scientific area of Neurology. Dr. Raghavendra Sannegowda is serving as an honorary author for Journal of Neurological Disorders & other reputed journals and has authored several articles along with chapters in different books related to Neurology, Neuroscience.
