

Preventive interventions for a particular population to reduce the prevalence of obesity among children of racial background.

Wani Sarfaraz Hassan

Astana Medical University, Kazakhstan

Abstract

The obesity epidemic is occurring among boys and girls throughout the world among younger children and adolescents across all socioeconomic groups and among all racial and ethnic subpopulation. The rates of obesity among young children are alarmingly high or increasing faster than average. The children are at highest risk for obesity often experienced other social economic and health disparities concurrently and don't live in an environment that inherently support health promoting behaviours. The trends in childhood obesity its nutritional and other risk factors and treatment strategies particular emphasis is given to early-onset obesity in preschool children, which as precursor to later childhood and adult obesity, provides insights into that developmental origins of obesity and also offers the potential for early preventative approaches with large lasting benefits
