

Restoration of the endodontically treated teeth

Ghazi H M Altwairqi

Taif University, KSA

Abstract

The most important aim of modern dentistry is to preserve the tooth even the root of the tooth as much as you can. If you loose the crown and you have the chance to build up the tooth again to be functioning normally in order to manage the root and prepare it for build up some important factors you have to keep in mind to gain high percent of success. Keeping the root is much better than any other mean of restoration because of proprioception response.

My lecture is mainly directed to general practional in dentistry and junior colleague, it will cover all aspects of good job in this branch of dentistry

Biography

Ghazi H. M. Altwairqi is a Endodontic consultant and a hard working dentist with an experience of around 30 years. He is giving a great attention to educate and motivate the community via lectures, seminars and do screening by visiting schools for 12-18 aged students.
