

Solutions might decrease the length of stay in ER Isolation rooms

Wadei Mustafa

Royal Commission Medical Centre, Saudi Arabia

Abstract

Length of stay in the isolation rooms at ERs is something worth studying in details, especially nowadays in the era of COVID-19. There is no doubt that keeping a patient in the isolation room of ER for long time meaning a high source of infection to other patients who present nearby, and to staff as well; Furthermore, keeping the isolation rooms of ER occupied is considered high risk by itself, as such rooms are in demand in the time of COVID-19.

It is my honour to introduce this study as to reduce the length of stay of infected patients, specifically those infected with COVID-19, inside the isolation rooms of ER. The study took place at Royal Commission Medical Centre/ Yanbu, Saudi Arabia. The study is talking about reasons behind long period of stay inside the isolation rooms of ER, and root causes of those reasons. As well as the solutions which facilitate shortening the length of stay in the isolation rooms of ER.

Note: This work is partly presented at International Conference on Critical care and Emergency Medicine
