## Impacts of Climate Change on human health in Nepal

**Bharat Nepali**

Dhaulashree Power Company, Nepal

Nepal is one of the climate change prone countries in the world. Geophysical and socioeconomic condition of country have predetermined vulnerability of the country to drought, earthquake, epidemic, fire, flood, forest fire, land slide and other climate related events affecting human and animal health, injuries, and quality of life. In light of such a situation we aimed to review knowledge related to potential health impacts of climate change on population of Nepal. Literature search using major public health, environmental and social databases as well as international reports was completed to get an overview of existing knowledge. There is a little published knowledge related to potential health impacts of climate change on population of Nepal. However, the knowledge of relationship between climate change and health and knowledge of environment allow discussing main routes of potential impact as well as health effects is a crucial

issue to explore. More direct, population based research would be necessary to provide sound knowledge for emergency planning and mitigation measures. The scientific evidence on climate change is complex and difficult to understand by non-expert, but there is a strong acceptance that the earth's climate is changing more rapidly that might be expected and such changes are likely to have results from human activities.
