Alzheimer's cognitive impairment can be recovered by decreasing homocysteic acid in blood

Caron Leid

Aspen University, Canada

Although more and more people are being affected by Alzheimer's disease, there is not enough information surrounding the true daily struggle of the disease. Due to that reason, I felt there was a huge gap for those in the sandwich generation. My mother was diagnosed with

Atypical Alzheimer's disease at the age of 57. The book which I wrote is a journey to assist others with resources and the struggle of living with the disease, from a raw perspective.
