Successful pregnancy outcome in retrograde ejaculation—interesting case report

Retrograde ejaculation is the most common cause for Rejaculatory dysfunction and it accounts for 0.3–2% of male infertility. It is a condition in which no or minimal antegrade ejaculate is produced although orgasm is present and all the sensations of ejaculation may be present. The common etiologies are surgical causes (bladder neck surgery, retroperitoneal lymph node dissection surgery for testicular cancer or prostate surgery), medications (high blood pressure, prostate enlargement and depression) and nerve damage causes (diabetes, multiple sclerosis, Parkinson's disease or a spinal cord injury). In our case report, 22-year-old female presented with primary infertility with regular periods and ultrasound showed polycystic pattern of ovary. Husband semen analysis showed aspermia with history of cloudy urine. The diagnosis of retrograde ejaculation was made. The sperms collected from urine showed low count and motility and IVF

with ICSI was advised. The female became pregnant in first cycle only and ultrasound showed single live fetus.

Speaker Biography

Kaberi Banerjee is a seasoned Obstetrician and Gynecologist with more than a decade of experience in IVF infertility management. She is an infertility and IVF Specialist, trained from the prestigious Guys and St. Thomas Hospital, London, where she went as a commonwealth scholar.
