THE CLINICAL CHARACTERISTICS AND OUTCOME OF H1N1 PNEUMONIA PATIENTS WITH AND WITHOUT ACUTE RENAL INJURY

Currently, little information exists about the impact of kidney injury and resource utilization in the form of renal replacement therapy in critically ill patients with H1N1 infections. 40 patients who were living in or visitors to Makkah region, admitted to the hospital and revealed confirmatory H1N1 infection, pneumonia and acute renal injury, were submitted to rRT-PCR. Severity of illness was assessed by using APACHE II, SOFA score, MOD score XR chest score, PaO₂/FIO₂ and Co-morbidities were recorded. Acute renal injury is an adding impact of increasing the mortality rate of H1N1 pneumonia patients and may be related directly to the infection by this virus or complication to it which may be explained by severe hypoxia secondary to severe lung injury, multi organ dysfunction. A high mortality in middle and old- aged patients with underlying medical co-morbidities was associated with higher symptoms severity, APACHE II, SOFA, MODS and XRC scores. Early recognition of the disease as well as prompt medical attention to provide opportunities aiming to limit the progression of the illness and to reduce the mortality. Prospective and controlled clinical trials are needed for clarifying the effectiveness of the early treatment and protection by using H1N1 vaccine.
